## **Trapezoidal Numbers**

## Compute

- 1. What is the sum 3 + 4 + 5?
- 2. What is the sum 4 + 5 + 6 + 7 + 8?
- 3. What is the sum 5 + 6 + ... + 80 + 81?

All of the results of these computations are called *trapezoidal* numbers, because you can draw a trapezoid that illustrates the answer to problem 1 with dots or blocks like this:

where each row has one more dot than the row before. So for instance 13 is trapezoidal because it is equal to 6 + 7. A trapezoidal number has to have at least two rows.

## Patterns

- 4. What numbers can be written as 2-row trapezoidal numbers, like 13?
- 5. What numbers can be written as 3-row trapezoidal numbers, like 3 + 4 + 5?
- 6. What numbers can be written as 4-row trapezoidal numbers?
- 7. What about 5-row, 6-row, and so on? Can you explain a general rule, so that we can tell whether 192 is a 12-row trapezoidal number?
- 8. Can you name a large number that is not trapezoidal, no matter what number of rows you try? How do you know it can't be trapezoidal?
- 9. Can you name a large number that is trapezoidal in only one way? How do you know?
- 10. How many trapezoidal representations does 100 have? Why? How about 1000?
- 11. How many trapezoidal representations does 221 have? Why?
- 12. How can you determine how many trapezoidal representations a number has?
- 13. What if we allow negative numbers, like -2 + -1 + 0 + 1 + 2 + 3 + 4 + 5, in a trapezoidal representation? What if we allow "staircases" like 3 + 7 + 11?
